

# EV myths busted

Llywodraeth Cymru  
Welsh Government

Electric vehicles (EVs) will become common place in the not-too-distant future, as the government has set out a plan to phase out cars with the common internal combustion engine that run on petrol or diesel. If you're thinking of buying a new car, why not look at electric options?

**Here are some of the most common myths debunked:**

## EVs have good range

More than 1 in 5 car journeys in Wales are under 2 miles, this is well within the 125 – 270 mile range of the latest 100% electric cars (that would take you from Cardiff to Aberystwyth and back again!).

Additionally there are already 500 public charging points across Wales.

Still nervous about range? Find out how far you can drive at [www.goultralow.com](http://www.goultralow.com)

## Electric cars are fast

EVs have faster acceleration than an equivalent petrol or diesel - this is a result of instant torque. There are electric cars on the market that can accelerate from 0-60 miles per hour in under 8 seconds.

## EVs are affordable to buy

Electric cars, like petrol or diesel, are available at a range of price points, starting from £18,000.

And unlike their polluting counterparts, electric cars are currently completely exempt from car tax– as they have zero emissions.

## EVs are affordable to run

Electricity is cheaper than petrol or diesel, and EV maintenance costs are less as the engines are simpler. As a result, your annual cost for running a pure electric car is about 10% lower than for petrol or diesel cars.

## There are lots of public charging points

The UK currently has over 13,000 charging points.

Plus £2million from the Welsh Government and Plaid Cymru will be invested in publicly accessible national network of rapid charging points by 2020.

## The National Grid can cope

Even if all 30 million of Britain's cars were electric, we would need an increase in Grid-delivered power of just 12%. And, because most of the charging will come at off-peak times, it won't require new Grid infrastructure, wires or power stations.

## EVs are safe

EVs have to undergo the same rigorous testing as any other motor vehicle, meaning they are just as safe. Plus EVs don't have any flammable fuel, and their centre of gravity is often lower meaning they are less likely to roll in a collision.
